Why Conversion

New IBC code has re-categorized cargoes which means that the product tankers can no longer carry chemical cargoes. This has direct repercussions on the carriage of vegetable oil which can no longer be carried by a product tanker.

This directly translates to loss of revenue for the owner because of restricted opportunities in carrying cargoes. However, the cost and time involved in changing a product tanker to a chemical tanker is minimal compared to the flexibility it gives in choosing the most profitable charter.

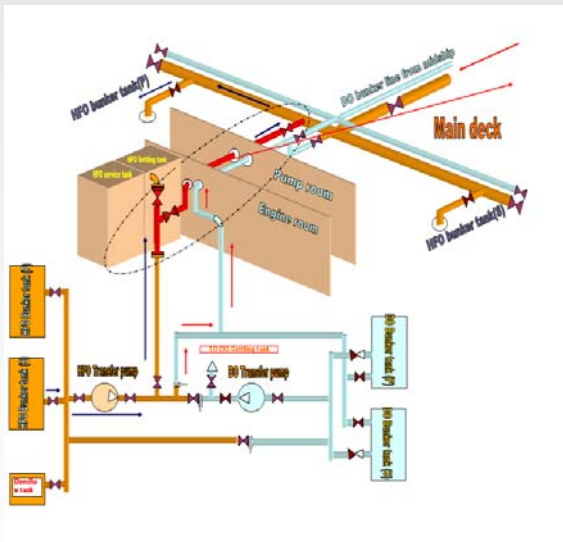

Why Vedam.....

Vedam provides complete solution for the conversion of a product tanker to any type of chemical tanker.

We provide a full package including feasibility study, planning, approval, material procurement and supervision for product tanker conversion.

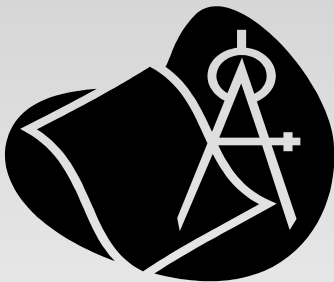

Vedam has an excellent pool of well qualified Naval Architects and Design Engineers capable of understanding the owner's need and providing customized designs and modifications.

This page can not be copied or used without authorization.

What all do we do....

Feasibility Study: Given a cargo list, Vedam can do a detailed feasibility study of the modifications required to comply with the carriage requirement of the same. Based on the initial study, an approximate cost for conversion to a suitable type of chemical tanker can be given.

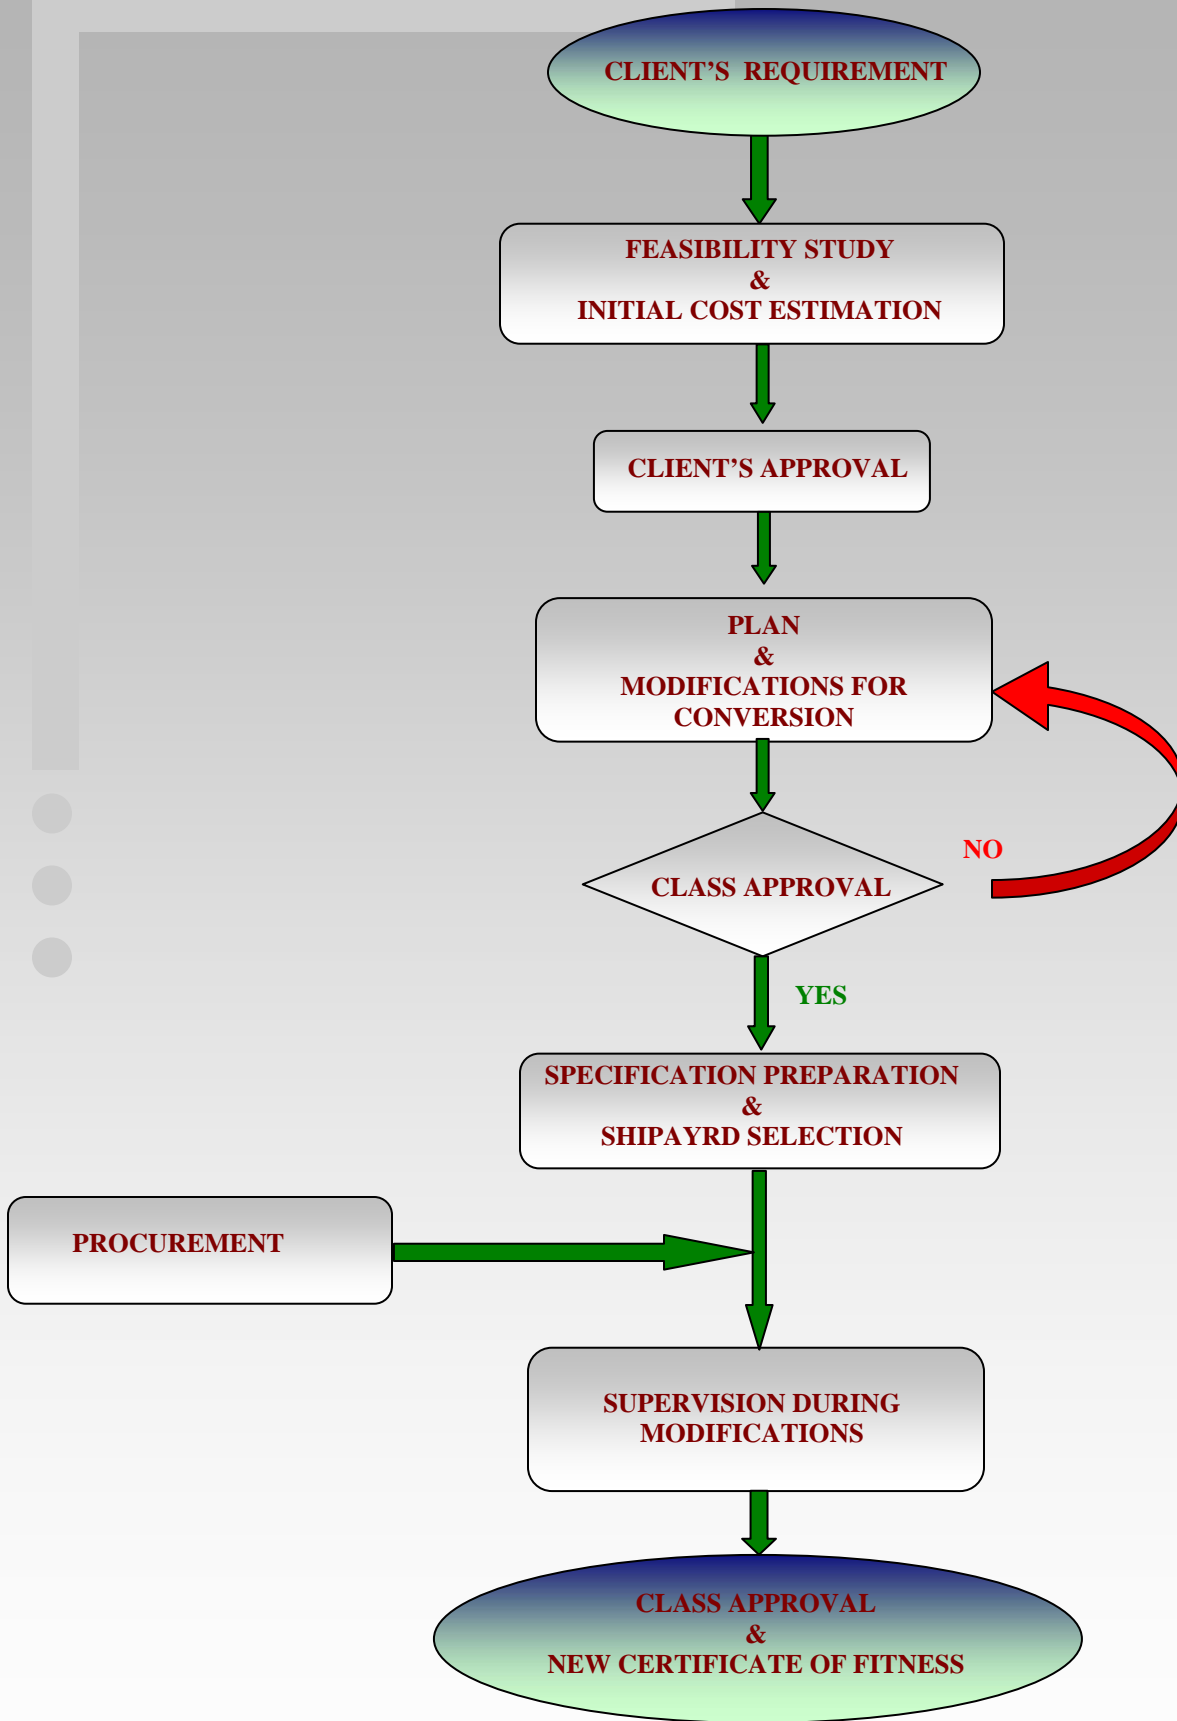

Design and Modifications: We provide customized design and modification solutions for carrying out tanker conversions. This includes coordination with the classification society and flag state for getting mandatory approvals.

Shipyard Selection & Supervision: Consultancy for selecting a suitable shipyard for carrying out the desired modifications can be provided. Supervision will include coordination with the shipyard for carrying out quality inspections during the dry-docking of the vessel.

Assistance can also be provided for the procurement of the requisite materials needed for the modification.
